

## The most definitive MC transformer from Ortofon MC-transformer ST-80

A new permalloy transformer encased in the aluminum cylinder  
(10mm thick wall) bored out of a solid aluminum block

The years of our R & D on MC transformer has prevailed in a new design that delivers the sound with exceptional warmth and round tonal quality. It has a larger bobbin, more layers of permalloy core and more coil windings. The transformer is placed in anti-magnetic permalloy case which in turn is inserted in a robust 10mm thick aluminum cylinder bored out of a solid aluminum block. The heavy metal case effectively isolates the environmental noise. The stability of the transformer is superb thanks to its 1.5kg heavy weight even when cables are attached. Its frequency range is 10Hz to 100 KHz with +/- 2dB and maintains the perfect flatness.

The convenient MC/MM switch on the front panel eliminates the need for the change of wire connections.
